Human S100A10

Human, recombinant protein expressed in *E. coli*.

Cat# CY-R2260

Amount: 100 µg (1.0 µg/µl)
Lot:**Introduction:**

S100A10, a member of the S100 family of Ca²⁺-binding proteins, is a dimeric protein composed of two 11-kDa subunits. The protein is cytosolic when present as a dimer. Typically, S100A10 is found in most cells bound to annexin A2 as the heterotetrameric (S100A10)₂-(annexin A2)₂ complex, AIIIt, in a calcium-independent manner. The formation of AIIIt results in the translocation of S100A10 to the plasma membrane. S100A10 has been shown to regulate plasma membrane ion channels as well as cytosolic phospholipase A2. In addition to an intracellular distribution, it has also been established that the heterotetrameric form of S100A10 is present on the extracellular surface of many cells. Extracellularly, the S100A10 subunit functions as a plasminogen receptor. The penultimate and ultimate carboxyl-terminal lysines of this subunit bind tPA and plasminogen and regulate the stimulation of tPA-dependent plasminogen activation.

Product Description:

Full length of human S100A10, containing an N-terminal GST tag, expressed in *E. coli*. and purified by GSH agarose chromatography.

Gene Information:

The gene accession number is NM_002966.

Gene Aliases:

Calpactin light chain, CAL12, CLP11, p11, p10, 42C

Formulation:

Recombinant human S100A10 is supplied frozen in phosphate buffered saline (PBS) containing 50 % glycerol.

For Research Use Only, Not for use in diagnostic procedures**Molecular Weight:** 34 kDa**Storage:**

Store product at -70°C. For optimal storage, aliquot target into smaller quantities after centrifugation and store at recommended temperature. For most favorable performance, AVOID REPEATED HANDLING AND MULTIPLE FREEZE/THAW CYCLES.

Stability:

Unopened vial at -70 °C, for 1 year after delivery.
